

To write a python script named `deploy_artifacts.py` :

1. The script should accept one command line argument , the path to build artifact file (myapp.jar , build.zip)
2. It should check if the file exist in the deployment directory:
if not then create
3. It should copy the build file to deployment directory
4. Provide clear output message
 - a. success msg : when deployment successful
 - b. Error msg : exit code 2 if deployment fails
5. If the user provides no or incorrect argument , display usage help and exit with code 1

Requirement

Make one file jar tar or zip

Make one folder deploy

bonus : add logic if the provided file actually exists before copying
